

# Shopping for $G_2$ -instantons on Aloff-Wallach spaces

Gonalo Oliveira on joint work with Gavin Ball

Departamento de Matemática, IST Lisboa

Pau, France, June 2023

## $G_2$ -structures

- ▶ Using  $\mathbb{R}^7 \cong \text{im } \mathbb{O}$  one can define the cross product

$$u \times v = \text{im}(u \cdot v),$$

## $G_2$ -structures

- Using  $\mathbb{R}^7 \cong \text{im } \mathbb{O}$  one can define the cross product

$$u \times v = \text{im}(u \cdot v),$$

which satisfies

$$(i) \ u \times v = -v \times u, \quad (ii) \ u \times v \perp u, \quad (iii) \ |u \times v|^2 = |u|^2|v|^2 - \langle u, v \rangle^2,$$

and follows that  $\varphi_0(u, v, w) = \langle u \times v, w \rangle$  is alternating.

## $G_2$ -structures

- ▶ Using  $\mathbb{R}^7 \cong \text{im } \mathbb{O}$  one can define the cross product

$$u \times v = \text{im}(u \cdot v),$$

which satisfies

$$(i) \ u \times v = -v \times u, \quad (ii) \ u \times v \perp u, \quad (iii) \ |u \times v|^2 = |u|^2|v|^2 - \langle u, v \rangle^2,$$

and follows that  $\varphi_0(u, v, w) = \langle u \times v, w \rangle$  is alternating.

- ▶ Define the *positive* 3-forms as

$$\Lambda_+^3 := \text{GL}(7, \mathbb{R}) \cdot \varphi_0 \subset \Lambda^3 \quad (\text{is open}),$$

and  $G_2 = \text{Stab}(\varphi_0)$ .

## $G_2$ -structures

- ▶ Using  $\mathbb{R}^7 \cong \text{im } \mathbb{O}$  one can define the cross product

$$u \times v = \text{im}(u \cdot v),$$

which satisfies

$$(i) \ u \times v = -v \times u, \quad (ii) \ u \times v \perp u, \quad (iii) \ |u \times v|^2 = |u|^2|v|^2 - \langle u, v \rangle^2,$$

and follows that  $\varphi_0(u, v, w) = \langle u \times v, w \rangle$  is alternating.

- ▶ Define the *positive* 3-forms as

$$\Lambda_+^3 := \text{GL}(7, \mathbb{R}) \cdot \varphi_0 \subset \Lambda^3 \quad (\text{is open}),$$

and  $G_2 = \text{Stab}(\varphi_0)$ .

- ▶  $\varphi \in \Lambda_+^3 \rightsquigarrow$  a Riemannian metric  $g_\varphi$  (ex:  $g_{\varphi_0} = \langle \cdot, \cdot \rangle$ ).

## $G_2$ -structures

- ▶ Using  $\mathbb{R}^7 \cong \text{im } \mathbb{O}$  one can define the cross product

$$u \times v = \text{im}(u \cdot v),$$

which satisfies

$$(i) \ u \times v = -v \times u, \quad (ii) \ u \times v \perp u, \quad (iii) \ |u \times v|^2 = |u|^2|v|^2 - \langle u, v \rangle^2,$$

and follows that  $\varphi_0(u, v, w) = \langle u \times v, w \rangle$  is alternating.

- ▶ Define the *positive* 3-forms as

$$\Lambda_+^3 := \text{GL}(7, \mathbb{R}) \cdot \varphi_0 \subset \Lambda^3 \quad (\text{is open}),$$

and  $G_2 = \text{Stab}(\varphi_0)$ .

- ▶  $\varphi \in \Lambda_+^3 \rightsquigarrow$  a Riemannian metric  $g_\varphi$  (ex:  $g_{\varphi_0} = \langle \cdot, \cdot \rangle$ ).
- ▶  $M^7$  a spin 7-manifold, a  $G_2$ -structure on  $M$  is a  $\varphi \in \Omega^3(M)$  such that:

$$\forall p \in M, \quad \varphi_p \in \Lambda_+^3 T_p^* M.$$

From now on, let  $\psi = *_\varphi \varphi \in \Omega^4(M)$ .

## Nearly parallel $G_2$ -structures

- ▶  $\nabla\varphi$  determined by  $d\varphi$  and  $d\psi$  which are given by

$$d\varphi = \tau_0\psi + 3\tau_1 \wedge \varphi + *\tau_3, \quad d\psi = 4\tau_1 \wedge \psi + \tau_2 \wedge \varphi,$$

for some  $\tau_i \in \Omega^i(M)$  called torsion forms.

## Nearly parallel $G_2$ -structures

- ▶  $\nabla\varphi$  determined by  $d\varphi$  and  $d\psi$  which are given by

$$d\varphi = \tau_0\psi + 3\tau_1 \wedge \varphi + *\tau_3, \quad d\psi = 4\tau_1 \wedge \psi + \tau_2 \wedge \varphi,$$

for some  $\tau_i \in \Omega^1(M)$  called torsion forms.

- ▶  $\varphi$  is *nearly parallel* if and only if

$$\tau_1 = \tau_2 = \tau_3 = 0, \text{ and } \tau_0 \neq 0 \quad \Leftrightarrow \quad d\varphi = \tau_0\psi, \tau_0 \in \mathbb{R} \setminus \{0\}.$$

For these,  $g_\varphi$  is Einstein with  $s_\varphi \sim \tau_0^2$ .

## Nearly parallel $G_2$ -structures

- ▶  $\nabla\varphi$  determined by  $d\varphi$  and  $d\psi$  which are given by

$$d\varphi = \tau_0\psi + 3\tau_1 \wedge \varphi + *\tau_3, \quad d\psi = 4\tau_1 \wedge \psi + \tau_2 \wedge \varphi,$$

for some  $\tau_i \in \Omega^i(M)$  called torsion forms.

- ▶  $\varphi$  is *nearly parallel* if and only if

$$\tau_1 = \tau_2 = \tau_3 = 0, \text{ and } \tau_0 \neq 0 \quad \Leftrightarrow \quad d\varphi = \tau_0\psi, \tau_0 \in \mathbb{R} \setminus \{0\}.$$

For these,  $g_\varphi$  is Einstein with  $s_\varphi \sim \tau_0^2$ .

- ▶ Other important case (for today): when  $\varphi$  is coclosed, i.e.  $d\psi = 0$ , or

$$\tau_1 = \tau_2 = 0.$$

## Nearly parallel $G_2$ -structures

- ▶  $\nabla\varphi$  determined by  $d\varphi$  and  $d\psi$  which are given by

$$d\varphi = \tau_0\psi + 3\tau_1 \wedge \varphi + *\tau_3, \quad d\psi = 4\tau_1 \wedge \psi + \tau_2 \wedge \varphi,$$

for some  $\tau_i \in \Omega^1(M)$  called torsion forms.

- ▶  $\varphi$  is *nearly parallel* if and only if

$$\tau_1 = \tau_2 = \tau_3 = 0, \text{ and } \tau_0 \neq 0 \quad \Leftrightarrow \quad d\varphi = \tau_0\psi, \tau_0 \in \mathbb{R} \setminus \{0\}.$$

For these,  $g_\varphi$  is Einstein with  $s_\varphi \sim \tau_0^2$ .

- ▶ Other important case (for today): when  $\varphi$  is coclosed, i.e.  $d\psi = 0$ , or

$$\tau_1 = \tau_2 = 0.$$

Relation to holonomy?

## Nearly parallel $G_2$ -structures

- ▶  $\nabla\varphi$  determined by  $d\varphi$  and  $d\psi$  which are given by

$$d\varphi = \tau_0\psi + 3\tau_1 \wedge \varphi + *\tau_3, \quad d\psi = 4\tau_1 \wedge \psi + \tau_2 \wedge \varphi,$$

for some  $\tau_i \in \Omega^1(M)$  called torsion forms.

- ▶  $\varphi$  is *nearly parallel* if and only if

$$\tau_1 = \tau_2 = \tau_3 = 0, \text{ and } \tau_0 \neq 0 \quad \Leftrightarrow \quad d\varphi = \tau_0\psi, \tau_0 \in \mathbb{R} \setminus \{0\}.$$

For these,  $g_\varphi$  is Einstein with  $s_\varphi \sim \tau_0^2$ .

- ▶ Other important case (for today): when  $\varphi$  is coclosed, i.e.  $d\psi = 0$ , or

$$\tau_1 = \tau_2 = 0.$$

### Relation to holonomy?

- ▶ If  $\varphi$  is nearly parallel, the metric cone  $\mathbb{R}_r^+ \times M^7$  with  $g_C = dr^2 + r^2g_\varphi$ , has holonomy  $\subsetneq \text{SO}(8)$ , so by Berger and Gallot must be

$$\{1\} \subset \text{Sp}(2) \subset \text{SU}(4) \subset \text{Spin}(7) \subset \text{SO}(8),$$

and  $g_\varphi$  is tri-Sasakian, Sasaki-Einstein, strictly nearly parallel respectively.

## Nearly parallel $G_2$ -structures

- ▶  $\nabla\varphi$  determined by  $d\varphi$  and  $d\psi$  which are given by

$$d\varphi = \tau_0\psi + 3\tau_1 \wedge \varphi + *\tau_3, \quad d\psi = 4\tau_1 \wedge \psi + \tau_2 \wedge \varphi,$$

for some  $\tau_i \in \Omega^1(M)$  called torsion forms.

- ▶  $\varphi$  is *nearly parallel* if and only if

$$\tau_1 = \tau_2 = \tau_3 = 0, \text{ and } \tau_0 \neq 0 \quad \Leftrightarrow \quad d\varphi = \tau_0\psi, \tau_0 \in \mathbb{R} \setminus \{0\}.$$

For these,  $g_\varphi$  is Einstein with  $s_\varphi \sim \tau_0^2$ .

- ▶ Other important case (for today): when  $\varphi$  is coclosed, i.e.  $d\psi = 0$ , or

$$\tau_1 = \tau_2 = 0.$$

### Relation to holonomy?

- ▶ If  $\varphi$  is nearly parallel, the metric cone  $\mathbb{R}_r^+ \times M^7$  with  $g_C = dr^2 + r^2g_\varphi$ , has holonomy  $\subsetneq \text{SO}(8)$ , so by Berger and Gallot must be

$$\{1\} \subset \text{Sp}(2) \subset \text{SU}(4) \subset \text{Spin}(7) \subset \text{SO}(8),$$

and  $g_\varphi$  is tri-Sasakian, Sasaki-Einstein, strictly nearly parallel respectively.

## $G_2$ -Instantons

- ▶  $\mathcal{A}$  connection on a  $G$ -bundle  $P$  over  $(M, \varphi)$ . Its Yang-Mills energy is

$$\mathcal{E}(\mathcal{A}) = \int_M |F_{\mathcal{A}}|^2 \text{vol}_{g_{\varphi}},$$

where  $F_{\mathcal{A}} \in \Omega^2(M, \mathfrak{g}_P)$  is the curvature of  $\mathcal{A}$ .

## $G_2$ -Instantons

- ▶  $\mathcal{A}$  connection on a  $G$ -bundle  $P$  over  $(M, \varphi)$ . Its Yang-Mills energy is

$$\mathcal{E}(\mathcal{A}) = \int_M |F_{\mathcal{A}}|^2 \text{vol}_{g_\varphi},$$

where  $F_{\mathcal{A}} \in \Omega^2(M, \mathfrak{g}_P)$  is the curvature of  $\mathcal{A}$ . Its critical points satisfy

$$\begin{aligned} d_{\mathcal{A}} F_{\mathcal{A}} &= 0, & \text{Biachi identity, valid for any connection, and} \\ d_{\mathcal{A}} * F_{\mathcal{A}} &= 0, & \text{Yang-Mills equation.} \end{aligned}$$

## $G_2$ -Instantons

- ▶  $\mathcal{A}$  connection on a  $G$ -bundle  $P$  over  $(M, \varphi)$ . Its Yang-Mills energy is

$$\mathcal{E}(\mathcal{A}) = \int_M |F_{\mathcal{A}}|^2 \text{vol}_{g_\varphi},$$

where  $F_{\mathcal{A}} \in \Omega^2(M, \mathfrak{g}_P)$  is the curvature of  $\mathcal{A}$ . Its critical points satisfy

$$\begin{aligned} d_{\mathcal{A}} F_{\mathcal{A}} &= 0, & \text{Bianchi identity, valid for any connection, and} \\ d_{\mathcal{A}} * F_{\mathcal{A}} &= 0, & \text{Yang-Mills equation.} \end{aligned}$$

- ▶ A connection  $\mathcal{A}$  is a  $G_2$ -instanton if

$$*F_{\mathcal{A}} = -F_{\mathcal{A}} \wedge \varphi \Leftrightarrow F_{\mathcal{A}} \wedge \psi = 0,$$

## $G_2$ -Instantons

- ▶  $\mathcal{A}$  connection on a  $G$ -bundle  $P$  over  $(M, \varphi)$ . Its Yang-Mills energy is

$$\mathcal{E}(\mathcal{A}) = \int_M |F_{\mathcal{A}}|^2 \text{vol}_{g_\varphi},$$

where  $F_{\mathcal{A}} \in \Omega^2(M, \mathfrak{g}_P)$  is the curvature of  $\mathcal{A}$ . Its critical points satisfy

$$\begin{aligned} d_{\mathcal{A}} F_{\mathcal{A}} &= 0, & \text{Biachi identity, valid for any connection, and} \\ d_{\mathcal{A}} * F_{\mathcal{A}} &= 0, & \text{Yang-Mills equation.} \end{aligned}$$

- ▶ A connection  $\mathcal{A}$  is a  $G_2$ -instanton if

$$*F_{\mathcal{A}} = -F_{\mathcal{A}} \wedge \varphi \Leftrightarrow F_{\mathcal{A}} \wedge \psi = 0,$$

which sits in an elliptic complex if  $\varphi$  is coclosed ( $d\psi = 0$ ).

## $G_2$ -Instantons

- ▶  $\mathcal{A}$  connection on a  $G$ -bundle  $P$  over  $(M, \varphi)$ . Its Yang-Mills energy is

$$\mathcal{E}(\mathcal{A}) = \int_M |F_{\mathcal{A}}|^2 \text{vol}_{g_{\varphi}},$$

where  $F_{\mathcal{A}} \in \Omega^2(M, \mathfrak{g}_P)$  is the curvature of  $\mathcal{A}$ . Its critical points satisfy

$$\begin{aligned} d_{\mathcal{A}} F_{\mathcal{A}} &= 0, & \text{Biachi identity, valid for any connection, and} \\ d_{\mathcal{A}} * F_{\mathcal{A}} &= 0, & \text{Yang-Mills equation.} \end{aligned}$$

- ▶ A connection  $\mathcal{A}$  is a  $G_2$ -instanton if

$$*F_{\mathcal{A}} = -F_{\mathcal{A}} \wedge \varphi \Leftrightarrow F_{\mathcal{A}} \wedge \psi = 0,$$

which sits in an elliptic complex if  $\varphi$  is coclosed ( $d\psi = 0$ ).

- ▶ If  $\varphi$  is nearly parallel ( $d\varphi = \tau_0\psi$ ),  $G_2$ -instantons are Yang-Mills

$$d_{\mathcal{A}} * F_{\mathcal{A}} = -d_{\mathcal{A}} F_{\mathcal{A}} \wedge \varphi - F_{\mathcal{A}} \wedge d\varphi = -\tau_0 F_{\mathcal{A}} \wedge \psi = 0.$$

## $G_2$ -Instantons

- ▶ A connection on a  $G$ -bundle  $P$  over  $(M, \varphi)$ . Its Yang-Mills energy is

$$\mathcal{E}(\mathcal{A}) = \int_M |F_{\mathcal{A}}|^2 \text{vol}_{g_\varphi},$$

where  $F_{\mathcal{A}} \in \Omega^2(M, \mathfrak{g}_P)$  is the curvature of  $\mathcal{A}$ . Its critical points satisfy

$$\begin{aligned} d_{\mathcal{A}} F_{\mathcal{A}} &= 0, & \text{Bianchi identity, valid for any connection, and} \\ d_{\mathcal{A}} * F_{\mathcal{A}} &= 0, & \text{Yang-Mills equation.} \end{aligned}$$

- ▶ A connection  $\mathcal{A}$  is a  $G_2$ -instanton if

$$*F_{\mathcal{A}} = -F_{\mathcal{A}} \wedge \varphi \Leftrightarrow F_{\mathcal{A}} \wedge \psi = 0,$$

which sits in an elliptic complex if  $\varphi$  is coclosed ( $d\psi = 0$ ).

- ▶ If  $\varphi$  is nearly parallel ( $d\varphi = \tau_0\psi$ ),  $G_2$ -instantons are Yang-Mills

$$d_{\mathcal{A}} * F_{\mathcal{A}} = -d_{\mathcal{A}} F_{\mathcal{A}} \wedge \varphi - F_{\mathcal{A}} \wedge d\varphi = -\tau_0 F_{\mathcal{A}} \wedge \psi = 0.$$

- ▶ However, for  $\tau_0 \neq 0$ , they need not be local minima of  $\mathcal{E}$

$$\mathcal{E}(\mathcal{A}) = \int_M \langle F_{\mathcal{A}} \wedge F_{\mathcal{A}} \rangle \wedge \varphi + \|F_{\mathcal{A}} \wedge \psi\|_{L^2}^2.$$

## $G_2$ -Instantons

- ▶ **Why  $G_2$ -Instantons?** Develop counting type invariant for  $G_2$ -manifolds.

## $G_2$ -Instantons

- ▶ **Why  $G_2$ -Instantons?** Develop counting type invariant for  $G_2$ -manifolds.
- ▶ **Why nearly parallel?** Interesting, and easier, testing ground.

## $G_2$ -Instantons

- ▶ **Why  $G_2$ -Instantons?** Develop counting type invariant for  $G_2$ -manifolds.
- ▶ **Why nearly parallel?** Interesting, and easier, testing ground.

If  $\varphi$  is nearly parallel:

- ▶  $G_2$ -instantons are Yang-Mills connections (as we saw).
- ▶ Any complex line bundle  $L$  admits a unique  $G_2$ -instanton (the connection whose curvature is the harmonic representative of  $c_1(L)$ ).

$\rightsquigarrow$  Just like for  $G_2$ -manifolds.

## $G_2$ -Instantons

- ▶ **Why  $G_2$ -Instantons?** Develop counting type invariant for  $G_2$ -manifolds.
- ▶ **Why nearly parallel?** Interesting, and easier, testing ground.

If  $\varphi$  is nearly parallel:

- ▶  $G_2$ -instantons are Yang-Mills connections (as we saw).
- ▶ Any complex line bundle  $L$  admits a unique  $G_2$ -instanton (the connection whose curvature is the harmonic representative of  $c_1(L)$ ).

$\rightsquigarrow$  Just like for  $G_2$ -manifolds.

But there are many differences as well!

( $\rightsquigarrow$  ex: nontrivial moduli and non-minimality).

Examples of nearly parallel  $\varphi$ ?

## Aloff-Wallach spaces

- Let  $k, l \in \mathbb{Z}$  and  $M_{k,l} = \text{SU}(3)/\text{U}(1)_{k,l}$ , where

$$\begin{pmatrix} e^{ik\theta} & 0 & 0 \\ 0 & e^{il\theta} & 0 \\ 0 & 0 & e^{im\theta} \end{pmatrix}, \quad \text{and } k + l + m = 0.$$

## Aloff-Wallach spaces

- ▶ Let  $k, l \in \mathbb{Z}$  and  $M_{k,l} = \text{SU}(3)/\text{U}(1)_{k,l}$ , where

$$\begin{pmatrix} e^{ik\theta} & 0 & 0 \\ 0 & e^{il\theta} & 0 \\ 0 & 0 & e^{im\theta} \end{pmatrix}, \quad \text{and } k + l + m = 0.$$

- ▶ Consider the left-invariant 1-forms  $\{\omega_1, \dots, \omega_7, \xi\}$ , with  $\xi$  the dual to the infinitesimal generator of  $\text{U}(1)_{k,l}$ .

## Aloff-Wallach spaces

- ▶ Let  $k, l \in \mathbb{Z}$  and  $M_{k,l} = \text{SU}(3)/\text{U}(1)_{k,l}$ , where

$$\begin{pmatrix} e^{ik\theta} & 0 & 0 \\ 0 & e^{il\theta} & 0 \\ 0 & 0 & e^{im\theta} \end{pmatrix}, \quad \text{and } k + l + m = 0.$$

- ▶ Consider the left-invariant 1-forms  $\{\omega_1, \dots, \omega_7, \xi\}$ , with  $\xi$  the dual to the infinitesimal generator of  $\text{U}(1)_{k,l}$ .

The most general coclosed, homogeneous  $G_2$ -structure is

$$\varphi = ABC(\omega_{123} - \omega_{167} + \omega_{257} - \omega_{356}) - D\omega_4 \wedge (A^2\omega_{15} + B^2\omega_{26} + C^2\omega_{37}),$$

for  $(A, B, C, D) \in \mathcal{C} = (\mathbb{R} \setminus 0)^4 / \mathbb{Z}_2^2$ .

## Aloff-Wallach spaces

- ▶ Let  $k, l \in \mathbb{Z}$  and  $M_{k,l} = \text{SU}(3)/\text{U}(1)_{k,l}$ , where

$$\begin{pmatrix} e^{ik\theta} & 0 & 0 \\ 0 & e^{il\theta} & 0 \\ 0 & 0 & e^{im\theta} \end{pmatrix}, \quad \text{and } k + l + m = 0.$$

- ▶ Consider the left-invariant 1-forms  $\{\omega_1, \dots, \omega_7, \xi\}$ , with  $\xi$  the dual to the infinitesimal generator of  $\text{U}(1)_{k,l}$ .

The most general coclosed, homogeneous  $G_2$ -structure is

$$\varphi = ABC(\omega_{123} - \omega_{167} + \omega_{257} - \omega_{356}) - D\omega_4 \wedge (A^2\omega_{15} + B^2\omega_{26} + C^2\omega_{37}),$$

for  $(A, B, C, D) \in \mathcal{C} = (\mathbb{R} \setminus 0)^4 / \mathbb{Z}_2^2$ . Its associated the metric is

$$g_\varphi = A^2 (\omega_1^2 + \omega_5^2) + B^2 (\omega_2^2 + \omega_6^2) + C^2 (\omega_3^2 + \omega_7^2) + D^2 \omega_4^2.$$

## Aloff-Wallach spaces

- ▶ Let  $k, l \in \mathbb{Z}$  and  $M_{k,l} = \text{SU}(3)/\text{U}(1)_{k,l}$ , where

$$\begin{pmatrix} e^{ik\theta} & 0 & 0 \\ 0 & e^{il\theta} & 0 \\ 0 & 0 & e^{im\theta} \end{pmatrix}, \quad \text{and } k + l + m = 0.$$

- ▶ Consider the left-invariant 1-forms  $\{\omega_1, \dots, \omega_7, \xi\}$ , with  $\xi$  the dual to the infinitesimal generator of  $\text{U}(1)_{k,l}$ .

The most general coclosed, homogeneous  $G_2$ -structure is

$$\varphi = ABC(\omega_{123} - \omega_{167} + \omega_{257} - \omega_{356}) - D\omega_4 \wedge (A^2\omega_{15} + B^2\omega_{26} + C^2\omega_{37}),$$

for  $(A, B, C, D) \in \mathcal{C} = (\mathbb{R} \setminus 0)^4 / \mathbb{Z}_2^2$ . Its associated the metric is

$$g_\varphi = A^2 (\omega_1^2 + \omega_5^2) + B^2 (\omega_2^2 + \omega_6^2) + C^2 (\omega_3^2 + \omega_7^2) + D^2 \omega_4^2.$$

- ▶  $\varphi$  nearly parallel  $\Leftrightarrow$  quartic equation on  $(A, B, C, D) \in \mathcal{C}$ , with exactly 2 solutions for  $k \neq \pm l$ . These, correspond to strictly nearly parallel  $\varphi$ ! (Cabrera, Monar and Swann)

## $G_2$ -Instantons with $G = U(1)$

- ▶ The duals of  $\xi$  and  $\omega_4$  generate the maximal torus  $T^2 \subset SU(3)$

## $G_2$ -Instantons with $G = U(1)$

- ▶ The duals of  $\xi$  and  $\omega_4$  generate the maximal torus  $T^2 \subset SU(3)$  and an invariant  $U(1)$ -connection can be written as

$$\mathcal{A} = n \xi + b \omega_4 \in \Omega^1(SU(3), \mathfrak{u}(1)),$$

for  $b \in \mathbb{R}$  and  $n \in \mathbb{Z} \cong H^2(X_{k,l}, \mathbb{Z})$ .

## $G_2$ -Instantons with $G = U(1)$

- ▶ The duals of  $\xi$  and  $\omega_4$  generate the maximal torus  $T^2 \subset SU(3)$  and an invariant  $U(1)$ -connection can be written as

$$\mathcal{A} = n \xi + b \omega_4 \in \Omega^1(SU(3), \mathfrak{u}(1)),$$

for  $b \in \mathbb{R}$  and  $n \in \mathbb{Z} \cong H^2(X_{k,l}, \mathbb{Z})$ .

- ▶ Write  $\psi = -D\omega_4 \wedge \Upsilon + \frac{1}{2}\omega^2$ , with  $(\Upsilon, \omega)$  inducing a Hermitian str. on  $\frac{SU(3)}{T^2}$ .

## $G_2$ -Instantons with $G = U(1)$

- ▶ The duals of  $\xi$  and  $\omega_4$  generate the maximal torus  $T^2 \subset SU(3)$  and an invariant  $U(1)$ -connection can be written as

$$\mathcal{A} = n \xi + b \omega_4 \in \Omega^1(SU(3), \mathfrak{u}(1)),$$

for  $b \in \mathbb{R}$  and  $n \in \mathbb{Z} \cong H^2(X_{k,l}, \mathbb{Z})$ .

- ▶ Write  $\psi = -D\omega_4 \wedge \Upsilon + \frac{1}{2}\omega^2$ , with  $(\Upsilon, \omega)$  inducing a Hermitian str. on  $\frac{SU(3)}{T^2}$ .
- ▶ Turns out that  $d\xi \wedge \Upsilon = 0 = d\omega_4 \wedge \Upsilon$  always, while

$$d\xi \wedge \omega^2 \sim \Delta \omega^3 \quad \text{and} \quad d\omega_4 \wedge \omega^2 \sim \Gamma \omega^3 \quad \text{where,}$$

$$\Delta = A^2 B^2 l + A^2 C^2 k + B^2 C^2 m,$$

$$\Gamma = A^2 B^2 (m - k) + A^2 C^2 (l - m) + B^2 C^2 (k - l).$$

## $G_2$ -Instantons with $G = U(1)$

- ▶ The duals of  $\xi$  and  $\omega_4$  generate the maximal torus  $T^2 \subset SU(3)$  and an invariant  $U(1)$ -connection can be written as

$$\mathcal{A} = n \xi + b \omega_4 \in \Omega^1(SU(3), \mathfrak{u}(1)),$$

for  $b \in \mathbb{R}$  and  $n \in \mathbb{Z} \cong H^2(X_{k,l}, \mathbb{Z})$ .

- ▶ Write  $\psi = -D\omega_4 \wedge \Upsilon + \frac{1}{2}\omega^2$ , with  $(\Upsilon, \omega)$  inducing a Hermitian str. on  $\frac{SU(3)}{T^2}$ .
- ▶ Turns out that  $d\xi \wedge \Upsilon = 0 = d\omega_4 \wedge \Upsilon$  always, while

$$d\xi \wedge \omega^2 \sim \Delta \omega^3 \quad \text{and} \quad d\omega_4 \wedge \omega^2 \sim \Gamma \omega^3 \quad \text{where,}$$

$$\Delta = A^2 B^2 l + A^2 C^2 k + B^2 C^2 m,$$

$$\Gamma = A^2 B^2 (m - k) + A^2 C^2 (l - m) + B^2 C^2 (k - l).$$

### Proposition

- ▶ If  $\Delta \neq 0$ , each line bundle admits a unique invariant  $G_2$ -instanton;
- ▶ If  $\Delta = 0$  and  $\Gamma \neq 0$ , the only  $G_2$ -instantons live on the trivial line bundle;
- ▶ If  $\Delta = 0 = \Gamma$ ,  $\exists$  a real 1-parameter family of  $G_2$ -instantons on any line bundle.

## $G_2$ -Instantons with $G = U(1)$

### Proposition

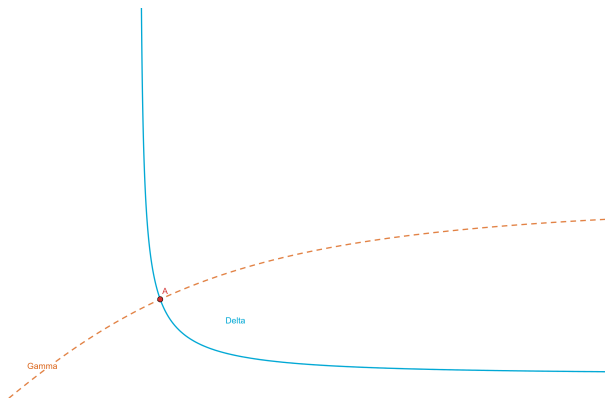

- ▶ If  $\Delta \neq 0$ , each line bundle admits a unique invariant  $G_2$ -instanton;
- ▶ If  $\Delta = 0$  and  $\Gamma \neq 0$ , the only  $G_2$ -instantons live on the trivial line bundle;
- ▶ If  $\Delta = 0 = \Gamma$ ,  $\exists$  a real 1-parameter family of  $G_2$ -instantons on any line bundle.

## $G_2$ -Instantons with $G = U(1)$

⇒ Uniqueness of  $G_2$ -instantons on complex line bundles does not generalize to arbitrary coclosed  $\varphi$ .

## $G_2$ -Instantons with $G = U(1)$

$\Rightarrow$  Uniqueness of  $G_2$ -instantons on complex line bundles does not generalize to arbitrary coclosed  $\varphi$ .

However, for the generic  $\varphi \in \mathcal{C}$ , each line bundle still admits a unique invariant  $G_2$ -instanton.

## $G_2$ -Instantons with $G = U(1)$

$\Rightarrow$  Uniqueness of  $G_2$ -instantons on complex line bundles does not generalize to arbitrary coclosed  $\varphi$ .

However, for the generic  $\varphi \in \mathcal{C}$ , each line bundle still admits a unique invariant  $G_2$ -instanton.

Now we go to  $G = SO(3)$ !

## Invariant $\mathrm{SO}(3)$ connections on $X_{k,l}$

- ▶ Homogeneous  $\mathrm{SO}(3)$ -bundles are parametrized by  $\lambda_n : \mathrm{U}(1)_{k,l} \rightarrow \mathrm{SO}(3)$

$$P_n = \mathrm{SU}(3) \times_{(\mathrm{U}(1)_{k,l}, \lambda_n)} \mathrm{SO}(3).$$

## Invariant $SO(3)$ connections on $X_{k,l}$

- ▶ Homogeneous  $SO(3)$ -bundles are parametrized by  $\lambda_n : U(1)_{k,l} \rightarrow SO(3)$

$$P_n = SU(3) \times_{(U(1)_{k,l}, \lambda_n)} SO(3).$$

- ▶ Fix a splitting  $\mathfrak{su}(3) = \mathfrak{u}(1)_{k,l} \oplus \mathfrak{m}$  and the linear map

$$d\lambda_n \oplus 0 : \mathfrak{su}(3) \rightarrow \mathfrak{so}(3).$$

## Invariant $SO(3)$ connections on $X_{k,l}$

- ▶ Homogeneous  $SO(3)$ -bundles are parametrized by  $\lambda_n : U(1)_{k,l} \rightarrow SO(3)$

$$P_n = SU(3) \times_{(U(1)_{k,l}, \lambda_n)} SO(3).$$

- ▶ Fix a splitting  $\mathfrak{su}(3) = \mathfrak{u}(1)_{k,l} \oplus \mathfrak{m}$  and the linear map

$$d\lambda_n \oplus 0 : \mathfrak{su}(3) \rightarrow \mathfrak{so}(3).$$

- ▶ The "canonical" invariant connection on  $P_n$  is its left-invariant extension

$$\mathcal{A}_c^n = d\lambda_n \oplus 0 \in \Omega^1(SU(3), \mathfrak{so}(3)).$$

## Invariant $SO(3)$ connections on $X_{k,l}$

- ▶ Homogeneous  $SO(3)$ -bundles are parametrized by  $\lambda_n : U(1)_{k,l} \rightarrow SO(3)$

$$P_n = SU(3) \times_{(U(1)_{k,l}, \lambda_n)} SO(3).$$

- ▶ Fix a splitting  $\mathfrak{su}(3) = \mathfrak{u}(1)_{k,l} \oplus \mathfrak{m}$  and the linear map

$$d\lambda_n \oplus 0 : \mathfrak{su}(3) \rightarrow \mathfrak{so}(3).$$

- ▶ The "canonical" invariant connection on  $P_n$  is its left-invariant extension

$$\mathcal{A}_c^n = d\lambda_n \oplus 0 \in \Omega^1(SU(3), \mathfrak{so}(3)).$$

Any other invariant connection on  $P_n$  can be written as  $\mathcal{A} = \mathcal{A}_c^n + \Lambda$ , for  $\Lambda$  the left-invariant extension of a  $U(1)_{k,l}$ -equivariant map

$$\Lambda : (\mathfrak{m}, \text{Ad}) \rightarrow (\mathfrak{so}(3), \text{Ad} \circ \lambda_n).$$

## Invariant $SO(3)$ connections on $X_{k,l}$

- ▶ Homogeneous  $SO(3)$ -bundles are parametrized by  $\lambda_n : U(1)_{k,l} \rightarrow SO(3)$

$$P_n = SU(3) \times_{(U(1)_{k,l}, \lambda_n)} SO(3).$$

- ▶ Fix a splitting  $\mathfrak{su}(3) = \mathfrak{u}(1)_{k,l} \oplus \mathfrak{m}$  and the linear map

$$d\lambda_n \oplus 0 : \mathfrak{su}(3) \rightarrow \mathfrak{so}(3).$$

- ▶ The "canonical" invariant connection on  $P_n$  is its left-invariant extension

$$\mathcal{A}_c^n = d\lambda_n \oplus 0 \in \Omega^1(SU(3), \mathfrak{so}(3)).$$

Any other invariant connection on  $P_n$  can be written as  $\mathcal{A} = \mathcal{A}_c^n + \Lambda$ , for  $\Lambda$  the left-invariant extension of a  $U(1)_{k,l}$ -equivariant map

$$\Lambda : (\mathfrak{m}, \text{Ad}) \rightarrow (\mathfrak{so}(3), \text{Ad} \circ \lambda_n).$$

- ▶ Decompose into irreducible  $U(1)_{k,l}$ -representations

$$\mathfrak{m} \cong \mathbb{R} \oplus \mathbb{C}_{k-l} \oplus \mathbb{C}_{l-m} \oplus \mathbb{C}_{m-k}, \quad \mathfrak{so}(3) \cong \mathbb{R} \oplus \mathbb{C}_n,$$

and Schur's lemma tells you the possible nonzero entries in  $\Lambda$ .

## $G_2$ -Instantons with $G = \text{SO}(3)$

For  $k \neq l$ , we can construct irreducible connections  $A$  if and only if  $n$  is either  $k - l$ ,  $l - m$ , or  $m - l$ . In each of these cases there is a continuous function

$$\sigma_n : \mathcal{C} \rightarrow \mathbb{R},$$

with for example  $\sigma_{k-l}(\varphi) = 3 \left( \frac{m}{2} - \frac{\sqrt{6}}{\sqrt{k^2+l^2+m^2}} \frac{AD}{BC} \right) \Delta + \frac{k-l}{2} \Gamma.$

## $G_2$ -Instantons with $G = \text{SO}(3)$

For  $k \neq l$ , we can construct irreducible connections  $A$  if and only if  $n$  is either  $k - l$ ,  $l - m$ , or  $m - l$ . In each of these cases there is a continuous function

$$\sigma_n : \mathcal{C} \rightarrow \mathbb{R},$$

with for example  $\sigma_{k-l}(\varphi) = 3 \left( \frac{m}{2} - \frac{\sqrt{6}}{\sqrt{k^2+l^2+m^2}} \frac{AD}{BC} \right) \Delta + \frac{k-l}{2} \Gamma.$

### Theorem (Classification)

*Irreducible, invariant,  $G_2$ -instantons on  $P_n$  exist if and only if:*

- ▶  $n$  is either  $k - l$ ,  $l - m$ , or  $m - k$ , and
- ▶  $\sigma_n(\varphi) > 0$ .

*In this case, there are exactly 2 such instantons.*

## $G_2$ -Instantons with $G = \text{SO}(3)$

For  $k \neq l$ , we can construct irreducible connections  $A$  if and only if  $n$  is either  $k - l$ ,  $l - m$ , or  $m - l$ . In each of these cases there is a continuous function

$$\sigma_n : \mathcal{C} \rightarrow \mathbb{R},$$

with for example  $\sigma_{k-l}(\varphi) = 3 \left( \frac{m}{2} - \frac{\sqrt{6}}{\sqrt{k^2+l^2+m^2}} \frac{AD}{BC} \right) \Delta + \frac{k-l}{2} \Gamma$ .

### Theorem (Classification)

*Irreducible, invariant,  $G_2$ -instantons on  $P_n$  exist if and only if:*

- ▶  $n$  is either  $k - l$ ,  $l - m$ , or  $m - k$ , and
- ▶  $\sigma_n(\varphi) > 0$ .

*In this case, there are exactly 2 such instantons.*

- ▶ What happens as we continuously deform  $\varphi \in \mathcal{C}$ ?

## $G_2$ -Instantons with $G = SO(3)$

For  $k \neq l$ , we can construct irreducible connections  $A$  if and only if  $n$  is either  $k - l$ ,  $l - m$ , or  $m - l$ . In each of these cases there is a continuous function

$$\sigma_n : \mathcal{C} \rightarrow \mathbb{R},$$

with for example  $\sigma_{k-l}(\varphi) = 3 \left( \frac{m}{2} - \frac{\sqrt{6}}{\sqrt{k^2+l^2+m^2}} \frac{AD}{BC} \right) \Delta + \frac{k-l}{2} \Gamma$ .

### Theorem (Classification)

*Irreducible, invariant,  $G_2$ -instantons on  $P_n$  exist if and only if:*

- ▶  $n$  is either  $k - l$ ,  $l - m$ , or  $m - k$ , and
- ▶  $\sigma_n(\varphi) > 0$ .

*In this case, there are exactly 2 such instantons.*

- ▶ What happens as we continuously deform  $\varphi \in \mathcal{C}$ ?

### Theorem (Deforming the $G_2$ -structure)

*Let  $n = k - l$  and  $\{\varphi(s)\}_{s \in \mathbb{R}} \subset \mathcal{C}$  a continuous family satisfying  $\sigma_{k-l}(\varphi(s)) > 0$ , for  $s < 0$  and  $\sigma_{k-l}(\varphi(s)) < 0$ , for  $s > 0$ . Then, as  $s \nearrow 0$ , the two irreducible  $G_2$ -instantons on  $P_n$  merge into the same reducible and obstructed one.*

## Example: $P_6$ on $X_{1,-5}$

- ▶  $\varphi(A) \in \mathcal{C}$ , the  $G_2$ -structures with  $B = C = D = 1$ .
- ▶ Existence of irreducible  $G_2$ -instantons is controlled by

$$\sigma_6(\varphi(A)) = (A^2 - 1)(12\sqrt{7}A - 42) > 0, \text{ i.e. for } A^2 < 1 \text{ or } A > \sqrt{7}/2.$$

## Example: $P_6$ on $X_{1,-5}$

- ▶  $\varphi(A) \in \mathcal{C}$ , the  $G_2$ -structures with  $B = C = D = 1$ .
- ▶ Existence of irreducible  $G_2$ -instantons is controlled by

$$\sigma_6(\varphi(A)) = (A^2 - 1)(12\sqrt{7}A - 42) > 0, \text{ i.e. for } A^2 < 1 \text{ or } A > \sqrt{7}/2.$$

Example:  $P_6$  on  $X_{1,-5}$

- ▶ Analogous to a family of stable bundles becoming polystable as the Kähler structure varies.

Example:  $P_6$  on  $X_{1,-5}$

- ▶ Analogous to a family of stable bundles becoming polystable as the Kähler structure varies.

## Example: Distinguishing strictly nearly parallel $G_2$ -structures

- ▶ Recall that for  $k \neq \pm 1$  there are exactly two inequivalent and homogeneous strictly nearly parallel  $G_2$ -structures which we denote by  $\varphi^\pm$ .

## Example: Distinguishing strictly nearly parallel $G_2$ -structures

- ▶ Recall that for  $k \neq \pm 1$  there are exactly two inequivalent and homogeneous strictly nearly parallel  $G_2$ -structures which we denote by  $\varphi^\pm$ .
- ▶ On  $X_{2,3}$ , we have

$$A^+ = 2.827, B^+ = 2.197, C^+ = 1.848, D^+ = 2.668,$$

$$\sigma_{-1}(\varphi^+) = -1857.936, \sigma_8(\varphi^+) = -753.703, \sigma_{-7}(\varphi^+) = 107.336,$$

while

$$A^- = 1.698, B^- = 2.658, C^- = 2.707, D^- = -1.708,$$

$$\sigma_{-1}(\varphi^-) = 705.209, \sigma_8(\varphi^-) = -1726.540, \sigma_{-7}(\varphi^-) = -1812.541.$$

## Example: Distinguishing strictly nearly parallel $G_2$ -structures

- ▶ Recall that for  $k \neq \pm 1$  there are exactly two inequivalent and homogeneous strictly nearly parallel  $G_2$ -structures which we denote by  $\varphi^\pm$ .
- ▶ On  $X_{2,3}$ , we have

$$A^+ = 2.827, B^+ = 2.197, C^+ = 1.848, D^+ = 2.668,$$

$$\sigma_{-1}(\varphi^+) = -1857.936, \sigma_8(\varphi^+) = -753.703, \sigma_{-7}(\varphi^+) = 107.336,$$

while

$$A^- = 1.698, B^- = 2.658, C^- = 2.707, D^- = -1.708,$$

$$\sigma_{-1}(\varphi^-) = 705.209, \sigma_8(\varphi^-) = -1726.540, \sigma_{-7}(\varphi^-) = -1812.541.$$

- ▶ Thus, irreducible, invariant  $G_2$ -instantons exist in both cases, but live on topologically distinct bundles:

$$w_2(E_{-7}) \equiv 1 \pmod{2} \quad , \quad p_1(E_{-7}) \equiv 11 \pmod{19}, \text{ and}$$

$$w_2(E_{-1}) \equiv 1 \pmod{2} \quad , \quad p_1(E_{-1}) \equiv 1 \pmod{19}.$$

## Example: Distinguishing strictly nearly parallel $G_2$ -structures

- ▶ Recall that for  $k \neq \pm 1$  there are exactly two inequivalent and homogeneous strictly nearly parallel  $G_2$ -structures which we denote by  $\varphi^\pm$ .
- ▶ On  $X_{2,3}$ , we have

$$A^+ = 2.827, B^+ = 2.197, C^+ = 1.848, D^+ = 2.668,$$

$$\sigma_{-1}(\varphi^+) = -1857.936, \sigma_8(\varphi^+) = -753.703, \sigma_{-7}(\varphi^+) = 107.336,$$

while

$$\sigma_{-1}(\varphi^-) = 705.209, \sigma_8(\varphi^-) = -1726.540, \sigma_{-7}(\varphi^-) = -1812.541.$$

- ▶ Thus, irreducible, invariant  $G_2$ -instantons exist in both cases, but live on topologically distinct bundles:

$$w_2(E_{-7}) \equiv 1 \pmod{2} \quad , \quad p_1(E_{-7}) \equiv 11 \pmod{19}, \text{ and}$$

$$w_2(E_{-1}) \equiv 1 \pmod{2} \quad , \quad p_1(E_{-1}) \equiv 1 \pmod{19}.$$

- ▶ This may be a general phenomena for the strictly nearly parallel  $G_2$ -structures on these  $X_{k,l}$  (with  $k \neq \pm 1$ ). We did not try very hard to prove it!

## Example: Non-minimal instantons for a nearly parallel $\varphi$ on $X_{1,-1}$

Level sets of the invariant Yang-Mills functional on  $P_{-1}$ .

## Example: Non-minimal instantons for a nearly parallel $\varphi$ on $X_{1,-1}$

Level sets of the invariant Yang-Mills functional on  $P_{-1}$ .

- ▶ Global minimum is the bottom one and is a reducible  $G_2$ -instanton.

## Example: Non-minimal instantons for a nearly parallel $\varphi$ on $X_{1,-1}$

Level sets of the invariant Yang-Mills functional on  $P_{-1}$ .

- ▶ Global minimum is the bottom one and is a reducible  $G_2$ -instanton.
- ▶ Two other local minima at the top are non-instanton Yang-Mills connections.

## Example: Non-minimal instantons for a nearly parallel $\varphi$ on $X_{1,-1}$

Level sets of the invariant Yang-Mills functional on  $P_{-1}$ .

- ▶ Global minimum is the bottom one and is a reducible  $G_2$ -instanton.
- ▶ Two other local minima at the top are non-instanton Yang-Mills connections.
- ▶ The two saddles are the irreducible  $G_2$ -instantons.

## Example: Non-minimal instantons for a nearly parallel $\varphi$ on $X_{1,-1}$

Level sets of the invariant Yang-Mills functional on  $P_{-1}$ .

- ▶ Global minimum is the bottom one and is a reducible  $G_2$ -instanton.
- ▶ Two other local minima at the top are non-instanton Yang-Mills connections.
- ▶ The two saddles are the irreducible  $G_2$ -instantons.

## $G_2$ -instantons on $X_{1,1}$

- ▶ When  $k = l$ , there are similar classification results for  $G_2$ -instantons with  $G = U(1), SO(3)$ .

## $G_2$ -instantons on $X_{1,1}$

- ▶ When  $k = l$ , there are similar classification results for  $G_2$ -instantons with  $G = U(1), SO(3)$ .
- ▶ Now there are two nearly parallel  $G_2$ -structures in  $\mathcal{C}$ , only one of which is strictly nearly parallel  $\varphi^{snp}$ , the other one being tri-Sasakian  $\varphi^{ts}$ .

## $G_2$ -instantons on $X_{1,1}$

- ▶ When  $k = l$ , there are similar classification results for  $G_2$ -instantons with  $G = U(1), SO(3)$ .
- ▶ Now there are two nearly parallel  $G_2$ -structures in  $\mathcal{C}$ , only one of which is strictly nearly parallel  $\varphi^{snp}$ , the other one being tri-Sasakian  $\varphi^{ts}$ .

### Theorem (Distinguishing $\varphi^{ts}$ and $\varphi^{snp}$ )

*There are no irreducible invariant  $G_2$ -instantons with  $G = SO(3)$  for  $\varphi^{ts}$ , but such  $G_2$ -instantons do exist for  $\varphi^{snp}$ .*

Thank you!
